(1) XSL Transformations (XSLT) 3.0 and XML Path Language (XPath) 3.1

The XSLT 3.0 specification defines the following conformance features, and the level upto which Xalan implements them.

- | | |
|----------------------------------|--|
| a) Basic XSLT processor | Supported |
| | XSLT 3.0 instructions and XPath language features, whose implementations are available are described in subsequent sections of this document, below. |
| b) Schema aware XSLT processor | Partially, supported |
| | An XML Schema document can be imported within XSL stylesheet using <code>xsl:import-schema</code> instruction, and XML schema's top level type definitions and element & attribute declarations may be used within the stylesheet. |
| | Schema aware feature where XML input document, resulting in XPath data model node tree having detailed type annotations on all possible nodes is not supported. i.e, Apache Xalan's XPath implementation is natively not schema aware. |
| c) Serialization feature | Supported |
| | A new support for <code>xsl:output method="json"</code> is available, in addition to existing <code>xsl:output method</code> values. |
| d) Streaming feature | Not supported |
| e) Dynamic evaluation feature | Supported |
| f) XPath 3.1 feature, for arrays | Supported |

g) Higher-order functions feature Supported

Following are details of XSL 3.0 family of language features, whose working implementation is available on Xalan's dev repos branch 'xalan-j_xslt3.0_mvn':

1.1) XSLT 3.0

XSLT version 3.0 specification : <https://www.w3.org/TR/xslt-30/>

- 1) xsl:for-each-group instruction
- 2) xsl:analyze-string instruction
- 3) xsl:iterate instruction
- 4) xsl:for-each instruction implementation improvements, for new XSLT 3.0 requirements.
Particularly, xsl:for-each instruction being able to iterate XPath atomic values in addition to nodes.
- 5) xsl:evaluate instruction
- 6) xsl:function instruction
- 7) xsl:sequence instruction
xsl:variable and xsl:param instruction's attribute "static"
XSL stylesheet instruction attribute "use-when" implementation
- 8) The following XSL stylesheet elements can now have attributes 'type' and 'validation' : xsl:element, literal result element (xsl:validation and xsl:attribute), xsl:attribute, xsl:copy-of, xsl:copy.
- 9) xsl:attribute element can now have both, "select" attribute and child sequence constructor. But only one of these is allowed to be present on xsl:attribute instruction as specified by XSLT 3.0 specification.
- 10) xsl:import-schema instruction
- 11) xsl:variable instruction evaluation to node set instead of result tree fragment (RTF). This XSLT specification change was first introduced in XSLT 2.0. With XSLT 1.0, if RTF has to be used as node set, then it has to be converted to node set using node-set extension function.
- 12) The sequence type expression "as" attribute on XSLT elements xsl:variable, xsl:template, xsl:function, xsl:param, xsl:with-param, xsl:evaluate.
- 13) XSL template tunnel parameters
- 14) xsl:value-of instruction can now produce result either via its "select" attribute, or by xsl:value-of instruction's child sequence constructor. xsl:value-of instruction can now have an attribute named 'separator' as well.

- 15) `xsl:merge` instruction
- 16) `xsl:fork` instruction
- 17) `xsl:source-document` instruction
- 18) `xsl:try` and `xsl:catch` instructions
- 19) `xsl:character-map` instruction
- 20) Specifying XSL transformation's initial template name and support for initial template's default name `xsl:initial-template`.
- 21) XSLT function implementations
 - a) New function implementations : `fn:current-grouping-key`, `fn:current-group`, `fn:regex-group`, `fn:current-merge-group`, `fn:current-merge-key`
 - b) Function implementation enhancements : `fn:system-property`
- 22) Implementation of XSLT 3.0 attributes `xpath-default-namespace` and `expand-text`
- 23) `xsl:mode` instruction
- 24) `xsl:perform-sort` instruction
- 25) `xsl:package` instruction

Support for following new Xalan XSL transformation properties:

`http://apache.org/xalan/validation` (used to enable XML input document validation when `xsl:import-schema` instruction is used within an XSL stylesheet, with default value false)

`http://apache.org/xalan/xslevaluate` (used to enable XSL stylesheet instruction `xsl:evaluate`, with default value false)

These new XSL transformation properties can be set, using Xalan's class `TransformerImpl` when XSL transformation is invoked via API, or via Xalan command line.

1.2) XPath 3.1

XPath version 3.1 specification : <https://www.w3.org/TR/xpath-31/>

- 1) Range "to" expression
- 2) Value comparison operators `eq`, `ne`, `lt`, `le`, `gt`, `ge`

- 3) Function item "inline function expression"
- 4) Dynamic function calls
- 5) "if" expression
- 6) "for" expression
- 7) Quantified expressions 'some', 'every'
- 8) "let" expression
- 9) Sequence constructor expression, using comma operator
- 10) String concatenation operator "||"
- 11) Node comparison operators "is", "<<", ">>"
- 12) Simple map operator '!'
- 13) Instance Of expression
- 14) Implementation of various new XML Schema built-in data types for use in XSLT 3.0 stylesheets and XPath 3.1 expressions. Implementation of, XPath constructor function calls (for e.g, `xs:string('hello')`, `xs:date('2005-10-07')` etc) for these supported XML Schema data types.

Following XML Schema built-in types are supported (depicted with XML Schema data type and subtype hierarchy as specified by W3C XML Schema data types specification):

```
xs:anyType
  xs:anySimpleType
    xs:anyAtomicType
      xs:anyURI
      xs:base64Binary
      xs:boolean
      xs:decimal
      xs:integer
        xs:long
          xs:int
            xs:short
              xs:byte
            xs:nonNegativeInteger
              xs:positiveInteger
                xs:unsignedLong
                  xs:unsignedInt
                    xs:unsignedShort
                      xs:unsignedByte
                xs:nonPositiveInteger
                  xs:negativeInteger
```

- xs:double
- xs:float
- xs:date
- xs:dateTime
- xs:time
- xs:duration
 - xs:dayTimeDuration
 - xs:yearMonthDuration
- xs:gDay
- xs:gMonth
- xs:gMonthDay
- xs:gYear
- xs:gYearMonth
- xs:hexBinary
- xs:QName
- xs:string
 - xs:normalizedString
 - xs:token
 - xs:language
 - xs:Name
 - xs:NCName
 - xs:ID
 - xs:IDREF
 - xs:NMTOKEN

In addition to above mentioned XML Schema built-in data types, an XML Schema type `xs:untyped` specified by XPath 3.1 specification has also been implemented.

15) Collation support

Within the context of XSL languages, a collation is a method by which text information is compared and sorted.

As specified by XPath 3.1 F&O spec, implementations of following collations are available:

15.1) The Unicode Codepoint Collation

15.2) The Unicode Collation Algorithm

Support for following collation uri query parameters is available : 'fallback', 'lang', 'strength'

For the collation's query "lang" parameter, all languages as those supported by Java's 'java.util.Locale' class are available within Xalan's XSLT 3.0 implementation (ref, <https://docs.oracle.com/javase/8/docs/api/java/util/Locale.html>).

For the collation's query "strength" parameter, following values are supported : 'primary', 'secondary', 'tertiary', 'identical'.

15.3) The HTML ASCII Case-Insensitive Collation

- 16) Sequence type expression
- 17) Map expression
- 18) Array expression
- 19) Cast expression
- 20) Castable expression
- 21) Treat expression
- 22) Named function reference
- 23) Map and array lookup using function call syntax,
Map and array lookup using unary lookup operator “?”
- 24) Arrow operator (=>)
- 25) Node combination operators union, intersect and except

1.3) XPath 3.1 functions

XPath version 3.1 F&O specification : <https://www.w3.org/TR/xpath-functions-31/>

Implementation of XPath built-in default functions namespace : <http://www.w3.org/2005/xpath-functions>

Implementation of XPath built-in math functions namespace : <http://www.w3.org/2005/xpath-functions/math>

Implementation of XPath built-in map functions namespace : <http://www.w3.org/2005/xpath-functions/map>

Implementation of XPath built-in array functions namespace : <http://www.w3.org/2005/xpath-functions/array>

1) Functions on numeric values

fn:abs

fn:ceiling

fn:floor

fn:round (implementation of an optional second argument, that's used to specify 'precision')

fn:round-half-to-even

Formatting integer

fn:format-integer

2) Context functions

fn:current-dateTime
fn:current-date
fn:current-time
fn:implicit-timezone
fn:default-collation

3) Functions giving access to external information

fn:doc
fn:doc-available
fn:collection
fn:unparsed-text
fn:unparsed-text-lines

4) Functions on strings

fn:string-join
fn:upper-case
fn:lower-case
fn:codepoints-to-string
fn:string-to-codepoints
fn:compare (with support for collation argument)
fn:codepoint-equal
fn:contains-token (with support for collation argument)
fn:contains (added support for collation argument)
fn:starts-with (added support for collation argument)
fn:ends-with (with support for collation argument)
fn:substring-before (added support for collation argument)
fn:substring-after (added support for collation argument)

5) String functions that use regular expressions

fn:matches
fn:replace
fn:tokenize
fn:analyze-string

6) Functions that compare values in sequences

fn:distinct-values (with support for collation argument)
fn:index-of (with support for collation argument)
fn:deep-equal (with support for collation argument)

7) Maths trigonometric and exponential functions

math:pi
math:exp
math:exp10
math:log
math:log10
math:pow
math:sqrt
math:sin
math:cos
math:tan
math:asin
math:acos
math:atan
math:atan2

8) Random numbers

fn:random-number-generator

9) Component extraction functions on durations

fn:years-from-duration
fn:months-from-duration
fn:days-from-duration
fn:hours-from-duration
fn:minutes-from-duration
fn:seconds-from-duration

10) Constructing xs:dateTime value

fn:dateTime

11) Component extraction functions on dates and times

fn:year-from-dateTime
fn:month-from-dateTime
fn:day-from-dateTime
fn:hours-from-dateTime
fn:minutes-from-dateTime
fn:seconds-from-dateTime
fn:timezone-from-dateTime
fn:year-from-date
fn:month-from-date
fn:day-from-date
fn:timezone-from-date
fn:hours-from-time
fn:minutes-from-time
fn:seconds-from-time
fn:timezone-from-time

12) Timezone adjustment functions on dates and time values

fn:adjust-dateTime-to-timezone

fn:adjust-date-to-timezone

fn:adjust-time-to-timezone

13) Built-in higher-order functions

fn:for-each

fn:filter

fn:fold-left

fn:fold-right

fn:for-each-pair

fn:sort (with support for collation argument)

fn:apply

Dynamic loading and execution, of XSLT stylesheets:

fn:transform

14) Functions on sequences

14.1 General functions on sequences

fn:empty

fn:exists

fn:head

fn:tail

fn:insert-before

fn:remove

fn:reverse

fn:subsequence

fn:unordered

14.2 Aggregate functions

fn:avg

fn:max

fn:min

15) Parsing and serializing

fn:parse-xml

fn:parse-xml-fragment

16) Accessors

fn:node-name

fn:string

fn:data

fn:base-uri

fn:document-uri

17) Functions related to QNames

fn:resolve-QName

fn:QName

18) Functions related to maps

map:merge

map:size

map:keys

map:contains

map:get

map:find

map:put

map:entry

map:remove

map:for-each

19) Functions related to arrays

array:size

array:get

array:put

array:append

array:subarray

array:remove

array:insert-before

array:head

array:tail

array:reverse

array:join

array:for-each

array:filter

array:fold-left

array:fold-right

array:for-each-pair

array:sort (with support for collation argument)

array:flatten

20) Functions on JSON data

fn:parse-json

fn:json-doc

fn:json-to-xml

fn:xml-to-json

(2) Features yet not implemented, or partially implemented

XSLT 3.0 instructions

- a) “Conditional Content Construction” instructions `xsl:where-populated`, `xsl:on-empty`, `xsl:on-non-empty`

Not implemented.

XSLT 3.0 spec, ref : These facilities are available whether or not streaming is in use, but they are introduced to the language specifically to make streaming easier.

- b) XSLT 3.0 map instructions

Not implemented.

XSLT 3.0 spec, ref (section 21) : When XSLT 3.0 is used with XPath 3.0, it extends the type system and data model of XPath 3.0 with an additional datatype: the map. The extensions to XPath 3.0 defined within XSLT 3.0 specification section 21 have been incorporated into XPath 3.1. Therefore, when an XSLT 3.0 processor implements the XPath 3.1 Feature, the relevant parts of XSLT 3.0 spec section 21 can be ignored.

XPath 3.1 features

Partially implemented features:

- a) Few XML Schema data types, for use with XPath 3.1 constructor function calls and sequence types are yet not supported.

The list of supported XML Schema data types with Apache Xalan Java, are described within this document's section 1.2) XPath 3.1 point 14) above.

(3) Xalan's XSLT 3.0 and XPath 3.1 test suite details

Xalan XSLT 3.0 development code's latest conformance results with W3C XSLT 3.0 test suite is available here : https://github.com/apache/xalan-java/blob/xalan-j_xslt3.0_mvn/src/test/java/org/apache/xalan/tests/w3c/xslt3/result/w3c_xslt3_testsuite_xalan-j_result.xml

Xalan XSLT 3.0 development code's own XSL test suite is available here : https://github.com/apache/xalan-java/tree/xalan-j_xslt3.0_mvn/src/test and the latest results of these XSL tests are available at locations, https://xalan.apache.org/xalan-j/xsl3/tests/xalan-j_xsl3_test_suite_result.xml & https://xalan.apache.org/xalan-j/xsl3/tests/xalan-j_xsl3_test_suite_result.html
